

BLOOD LEDGER

Somebody else paid for your sword.

UNDERCOLLATERALIZED LENDING, AS A DUNGEON CRAWLER
CREDITCOIN CC3 · ETHEREUM SEPOLIA · ATTESTCOIN PROTOCOL

FLEMING JOHN · BUIDL CTC 2026

TO BORROW \$100, YOU MUST FIRST POST \$150.

Onchain lending is stuck on overcollateralization. It works, but it only serves people who *already have the money*. That is a liquidity tool, not credit.

Real credit means being lent more than you can cover. That needs a reputation which is portable, public, and expensive to fake.

WHY IT DOES NOT EXIST

Credit scores live inside institutions, wallets are free to create, and reputation you mint between your own addresses is worth nothing.

WHAT IS NEEDED

A record that costs real money to build, cannot be farmed with two wallets, and survives without the app that wrote it.

MAKE THE REPUTATION THE GAME.

A patron stakes coin on Ethereum to fund a raider they have never met. The raider goes into a dungeon and decides when to turn back.

WALKS OUT

They split the haul.

Standing +28

FALLS

The patron's coin is gone. All of it.

Standing -86, and the ledger writes their name next to the loss.

The loan is also the difficulty curve. The more of the patron's coin you are carrying, the faster the dungeon sends things at you. Take the chain out and the difficulty goes with it — this is not a shop bolted onto a game.

STANDING PRICES THE BOND. AT 900 YOU POST NOTHING AT ALL.

STANDING	MUST LOCK	OF 0.1 TCTC
below 300	100%	0.100
300 and up	80%	0.080
450 and up	60%	0.060
600 and up	30%	0.030
750 and up	10%	0.010
900 and up	nothing	—

UNDERCOLLATERALIZED, EARNED

A fresh wallet opens at 500 and posts 60%.

Reaching 900 means raids actually run and debts actually cleared, every one of them on chain.

By then your name *is* the collateral.

SKIN IN THE GAME

Walk out and the bond returns whole. Fall and it goes to the patron you cost — the only thing making a thrown raid cost the raider anything.

TWO WALLETS CANNOT MANUFACTURE A REPUTATION.

Standing earned from the *same patron* halves every time that pair deals again, and stops entirely after five. Enforced in the contract, not the UI.

Reaching the top of the board costs **ten distinct funded wallets** and real Sepolia coin, every one of them visible on chain. A stake under 0.001 ETH buys no standing at all.

WHY IT NEEDS TWO CHAINS — AND USC BETWEEN THEM.

ETHEREUM

The vault holds the patron's coin and emits one event. It has never heard of Creditcoin.

ATTESTCOIN

Witnesses attest the Sepolia block. Once enough agree — about nine minutes — a proof can be built.

CREDITCOIN

The precompile verifies the proof, refuses one already spent, and reads the payment out of it.

The patron's capital **already lives on Ethereum**, and asking them to bridge first would be a worse product. But a debt and a reputation must outlive the raid, be cheap to write, and be readable by anyone — **Creditcoin's job**.

Creditcoin cannot see Ethereum. USC is the only honest answer to that, and the whole credit system hangs off it.

THE PROOF IS THE AUTHORITY, NOT THE MESSENGER

THREE PLACES, AND IT BREAKS WITHOUT ANY OF THEM.

1 — READING ATTESTATION STATE, IN THE BROWSER

`PrecompileChainInfoProvider` is polled for which chains are watched and how far the witnesses have got.

2 — USC AS THE GAME'S RANDOMNESS

Every dungeon floor is seeded from the last attested Ethereum block. Nobody chooses that number — not us, not the player. The HUD names it.

3 — PROVING THE PAYMENT TO THE CONTRACT

`ProofBuilder` fetches the Merkle and continuity proof. `TheLedger` extends `ASCBBase`, which calls the precompile at `0x...0FD2`, refuses a spent query id, and reads the staked amount **out of the proof** — never from the messenger.

• THE PRODUCT

TWO SEATS AT THE SAME TABLE.

GAMER A • THE PATRON

Types an address and **the ledger answers** — score, raids, repaid, lost, read live from Creditcoin before a single coin moves.

GAMER B • THE RAIDER

Locks the bond and decides when to turn back. The HUD names the **attested Ethereum block** this floor was carved from.

WHAT THE CONTRACT REFUSES.

The fight happens in the player's browser, so the haul is *reported*, not proved. We would rather say that here than have it found. The ledger bounds it:

```
ceiling  1.0 tCTC  (100× the stake, never below 100,000 coins)
```

```
claimed  100000000000000000001 wei
```

```
MoreThanTheDungeonHolds(pactId 4, claimed 100000000000000000001,  
                           most 100000000000000000000)
```

One wei over the line, refused on chain — `0x19d2b34a...c77d`. It costs the raider nothing but gas and strands nothing.

This bounds the lie; it does not end it. The real answer is replay — floors are seeded from an attested block, so a raid is deterministic and anyone can re-simulate it.

• DEPLOYED, NOT MOCKED

BOTH CONTRACTS ARE LIVE AND HOLDING REAL STATE.
